

**Report
Of
Evaluation of AI Agent Developer Intern at ScaleOn**

IILM
UNIVERSITY

Submitted To
School of Computer Science and Engineering
IILM University, Greater Noida, U.P.

In partial fulfilment of the requirement of degree of
B.Tech CSE

By

Name of Student: AKANSHU GOEL

Roll Number: CS-2341205

Section: 4CSE-1

Batch: 2026-2027

Organization: ScaleOn

Role: AI Agent Developer Intern

2026-27

CANDIDATE'S DECLARATION

I, Akanshu Goel, do hereby declare that the internship report titled "Report Of Evaluation of AI Agent Developer Intern at ScaleOn" has been completed by me to fulfil the requirement for the award of the degree of Bachelor of Technology in CSE. All the references have been quoted and I have not taken as such any material from any other source. I affirm to you that this report is my own and has not been submitted to any other institute for any degree/diploma requirement and further I shall be solely responsible for any kind of copyright violation in this regard.

Student Name: Akanshu Goel

Roll No.: CS-2341205

ACKNOWLEDGEMENT

I am using this opportunity to express my gratitude to everyone who supported me throughout the internship program at ScaleOn. I am thankful for their aspiring guidance, invaluable constructive criticism, and friendly advice during this work. I am sincerely grateful to my mentors and colleagues at ScaleOn for sharing their truthful and illuminating views on a number of technical issues related to this work, and to the faculty of the School of Computer Science and Engineering, IILM University, for their continuous support and guidance throughout the internship.

I also express my gratitude to my parents for their blessings.

Student Name: Akanshu Goel

Roll No.: CS-2341205

4. Project Description

4.1 Introduction

This report presents the work carried out during my internship as an AI Agent Developer Intern at ScaleOn. The internship focused on AI agent development across three of the company's product initiatives: ScaleProposal AI, a multi-agent business proposal generation platform; ScaleSocial AI, an enterprise multi-channel social media management suite; and ScaleOn Study Portal, a study/learning management platform. Over the course of the internship, I worked on designing and implementing multi-agent AI workflows, building backend services with FastAPI, integrating Google Gemini AI for content generation and reasoning, developing frontend components in Next.js, and supporting testing and documentation across these projects.

4.2 Organization Profile

ScaleOn is a technology company building AI-powered, agentic software products under the tagline "Scale Beyond Limits". The company runs a structured internship program (ScaleOn Internship Program 2026) that places interns on real, production-oriented projects spanning AI agent development, full-stack engineering, and product design, giving them direct exposure to how agentic AI systems are designed, built, and shipped.

4.3 Problem Statement

As ScaleOn's product portfolio grew, several knowledge-intensive and repetitive workflows remained largely manual: drafting client-facing business proposals, managing a consistent presence across multiple social media platforms, and organizing study/learning content for end users. The team needed AI agent-based systems that could take on well-defined parts of these workflows — generating structured proposals, composing and scheduling multi-platform social content, and serving study material through a documented API — while keeping outputs consistent, reviewable, and cost-effective to run.

4.4 Internship Objectives

- Design and implement a multi-agent AI pipeline (Planner, Pricing, Risk, Proposal agents) that generates structured, client-ready business proposals from a short project brief.

- Build secure, scalable FastAPI backend services with Pydantic schema validation to pass data reliably between agents and to the frontend.
- Integrate Google Gemini AI for content generation, reasoning, and structured output across the proposal and social-content-generation workflows.
- Develop responsive Next.js frontend interfaces for real-time interaction with AI workflows, including live progress streaming.
- Support testing, database persistence, and documentation to keep the codebase maintainable across all three projects.

4.5 Scope of the Internship

The scope of this internship was limited to the AI agent development and supporting engineering layer of the three assigned projects, rather than final production deployment or business decision-making. Specifically, the work covered: (a) building the multi-agent orchestration pipeline for ScaleProposal AI, including agent-to-agent schema contracts and real-time workflow streaming; (b) contributing backend and frontend features for ScaleSocial AI's multi-platform composer, AI writer engine, and analytics dashboard; (c) contributing to the backend and documentation of the ScaleOn Study Portal; and (d) writing automated tests and maintaining project documentation across all three codebases. Final production infrastructure decisions and commercial deployment remained outside the scope of the internship and were left to ScaleOn's core engineering team.

4.6 Technologies and Tools Used

- Next.js 15 (App Router), React, and TypeScript: Used to build the frontend interfaces for all three projects, including real-time workflow views, the multi-platform post composer, and dashboard pages.
- FastAPI (Python): The primary backend framework, used to expose REST endpoints, orchestrate the multi-agent proposal workflow, and stream progress via Server-Sent Events (SSE).
- Pydantic: Used to define strict schema contracts between agents (PlannerOutput, PricingOutput, RiskOutput, ProposalOutput) so each stage of the pipeline produces structured, verifiable output.

- Google Gemini AI (Gemini 2.5): Used for LLM-driven content generation and reasoning — powering the proposal-writing agents and the AI writer engine for social media copy.
- SQLAlchemy ORM with SQLite/PostgreSQL and Alembic: Used for persisting proposals, execution logs, and application data, with Alembic managing schema migrations.
- Celery and Redis: Used in ScaleSocial AI for background/scheduled publishing jobs and for Redis-backed API rate limiting.
- Supabase: Used for authentication (JWT-based) and PostgreSQL hosting in ScaleSocial AI.
- Pytest and Pytest-asyncio: Used to write automated backend tests with mock AI providers and in-memory database fixtures, keeping tests deterministic and fast.
- Git and GitHub: Used for version control and collaborative development across all three project repositories.

4.7 System Architecture

ScaleProposal AI follows an orchestrated multi-agent architecture: a Next.js client sends a proposal request to a FastAPI backend, which runs a ProposalWorkflow Orchestrator. The orchestrator invokes four specialized agents in sequence — PlannerAgent, PricingAgent, RiskAgent, and ProposalAgent — each consuming the structured Pydantic output of the previous agent and calling the Gemini AI service asynchronously. Progress is streamed to the client over per-workflow Server-Sent Events channels, and final results are persisted via SQLAlchemy.

ScaleSocial AI follows a layered architecture: a Next.js frontend communicates over REST (Bearer JWT-authenticated) with a FastAPI backend, which integrates with Supabase PostgreSQL for data storage, Redis and Celery for background/scheduled publishing jobs, and external social platform APIs (Twitter/X, LinkedIn, Meta) for content publishing and analytics retrieval.

ScaleOn Study Portal follows a conventional client-server architecture, with a documented REST API layer connecting the frontend application to a backend service and database for managing study material and content.

4.8 Methodology

Work on each project followed an iterative, feature-driven approach. For ScaleProposal AI, the multi-agent pipeline was built incrementally — starting with the PlannerAgent's schema and prompt design, then adding PricingAgent, RiskAgent, and finally ProposalAgent, with each stage tested independently against sample project briefs before wiring the full pipeline together. Pydantic schema contracts were used throughout to keep agent outputs structured and machine-verifiable, reducing the risk of malformed data propagating downstream.

For ScaleSocial AI, feature work centered on the multi-platform composer and AI writer engine, with attention to per-platform validation rules (such as character limits) and to security practices such as JWT-based identity checks on every user-scoped endpoint. For the Study Portal, work focused on backend API support and documentation.

Automated tests were written alongside feature work using Pytest, with mock AI providers substituted for live Gemini calls to keep the test suite deterministic and fast. Manual and automated verification (backend test suites, frontend type-checking) was carried out before features were considered complete, and documentation (README files, architecture notes) was kept up to date to support maintainability.

4.9 Expected Outcomes

- A working multi-agent proposal generation pipeline capable of producing structured, client-ready business proposals end-to-end, from a short project brief to a final document.
- A functional multi-platform social media composer and analytics dashboard supporting AI-assisted content creation and scheduled publishing.
- Backend and documentation support contributing to a usable study/learning portal for ScaleOn's Study Portal initiative.
- Improved practical proficiency in agentic AI system design, FastAPI backend development, and modern Next.js frontend engineering.
- Hands-on experience with real-world software engineering practices — automated testing, version control, API design, and security (JWT authentication, rate limiting).

4.10 Offer Letter and Other Communication Proof

The ScaleOn Internship Offer Letter (Intern ID: SO260037, dated 29 June 2026), confirming the internship position of AI Agent Developer Intern for the duration 01 July 2026 to 30 September 2026, is attached below as proof of engagement. The Internship Completion Certificate will be attached upon completion of the internship.

Internship Offer Letter

ScaleOn Internship Program 2026

Dear **Akanshu Goel**,

We are pleased to offer you the opportunity to join **ScaleOn** as an Intern.

We were impressed with your qualifications and your passion for **AI Agent Developer**, and we believe that you will make a valuable contribution to our team.

Position: AI Agent Developer Intern

Duration: 01 July 2026 to 30 September 2026

We look forward to welcoming you to the **ScaleOn** team and working together to achieve success. Thank you for choosing **ScaleOn** as the place to further your career and professional growth.

Sincerely,
HR team
ScaleOn
